EXTERNAL CAGE FOR STEAM AND DOWTHERM, FOR UP TO 3000 PSI STEAM WITH 1000°F SUPERHEAT

The Series 763 condensate level switch produces a switching action when a liquid level passes a selected elevation. The sensing element is mounted in an external cage. An external cage is utilized to minimize the effects of turbulence, boiling, and splashing on the measurement. This cage design can also be valved off from the process, cooled and depressurized; allowing inspection, testing, maintenance, etc. of the 763. The output signal from the 763 consists of 1 or more heavy SPDT dry contacts.

The unit has a strong heavy wall displacer sensing element. The weight of this element is partially offset by a pivoted counterweight. The displacer net weight is strictly a function of the earth's gravity. Switch action is unaffected by process temperature and other variables. This design allows the 763 to work reliably at temperatures over 1500°F (815°C).

The displacer is buoyed upwards by the liquid as the level rises. The counterweight is equipped with an embedded magnet which is rotated downward as the displacer rises. A second magnet, connected to the output switch, is located on the outside of the pressure containing cage wall. This magnet is in opposition to the counterweight magnet and is continuously engaged with the embedded magnet. The switch magnet field goes over center and the magnet is forced against the upper stop as the displacer passes the centerline of the cage. The output switch has been activated and is now positively held in the up position. It will not false switch because of vibration, shock loads, etc. Conversely, the switch magnet is forced against the lower stop and the output switch deactivates as the liquid level drops below the centerline of the cage. There are no cams, rollers, temperature sensitive springs, etc. to limit reliability.

The 763 is truly a very high reliability liquid level switch which operates at high temperatures and pressures. Only a single weight, kept in position by a pivot shaft, moves. Reliable magnet lines of force penetrate the cage wall and connect up to the output switch.
